1. Started

The customer opens the Loyalty Rewards System to begin a reward redemption request. No information has been entered yet.

2. Information Entered

The customer enters their Customer ID, claim date, reward category, item price, and comments before submitting the request.

3. Validating

The system checks that all required information is provided and valid. Invalid or missing information results in rejection or a request for correction.

4. Checking Points

The system calculates the points required based on the item price, with each point worth $0.10. It then compares the required points with the customer's available balance.

5. Validated

The customer has enough points to cover the full item price, and the reward is eligible for redemption. No points have been deducted yet.

6. Rejected

The request is rejected because of invalid information or insufficient points. The customer receives a message and can correct the issue before trying again.

7. Completed

The reward has been redeemed, the required points deducted, and the transaction recorded. The customer receives confirmation. This is planned functionality for a future version of the system.
